

Gas Detection.

From planning to maintenance

We support you in your projects.

Concept and planning

Trust in our planning expertise: the modular design of our gas warning systems enables us to create a customised solution for your on-site requirements, taking into account the architectural conditions.

Training

Through our in-house MSR Academy, we offer you individual, certified basic training courses as well as advanced training with practical exercises to deepen your knowledge. Our experienced instructors are also available for individual customer training sessions.

Commissioning and functional testing

We commission your fully assembled and wired system and hand it over to you after a successful functional test and instruction. We are happy to assist at the approval of the gas warning system by an authorised inspector.

Maintenance

Gas detection systems are of central importance for the safety of people and systems. To ensure the functionality and longevity of these systems, we are happy to offer you regular maintenance by qualified specialists.
